Motivation

- Abundance of functional data
- Successes of Deep Learning
- Applications of Generative Modelling

Outline

- Functional Data
- Background and Theory
- Variational Autoencoders on Hilbert spaces
- Simulations
- Application
- Conclusion

Functional Data

- Observations are functions in $L^2([0, 1])$
- Infinite degrees of freedom
- $\{x_i\}_{i=1}^N$, where $x_i = (X_i(t_{ij}))_{j=1}^M$ for $t_{i1}, \dots, t_{iM} \in \mathcal{I}$

Figure: Sugar spectra (Source¹)

Why take a functional approach?

- Allows evaluation at any point in time
- Continuity, smoothness, and derivatives
- Multivariate methods may not be robust $M \gg N$

Grid Refinement Invariance Principle (GRIP)

Theorem (GRIP)

Methods for functional data should be robust under changes of the dimension of the representation as long as the dimension is large enough to give an accurate representation.

How to devise methods appropriately?

- Method for functional data and project into finite dimensions
- Method for multivariate data and check limit as $M \rightarrow \infty$

Basis Expansions

Proposition

Any $f \in L^2(\mathcal{D})$ with an orthonormal basis $\{e_n\}_{n=1}^{\infty}$ can be written as

$$f(t) = \sum_{n=1}^{\infty} f_n e_n(t),$$

where $f_n = \int_{\mathcal{D}} f(t) e_n(t) dt$.

- In practice truncated to a suitable number of basis functions B

$$f(t) \approx \sum_{n=1}^B f_n e_n(t)$$

Different bases - Fourier basis

$$e_1(t) = 1,$$
$$e_2(t) = \sqrt{2}\sin(2\pi t),$$
$$e_3(t) = \sqrt{2}\cos(2\pi t), \text{ etc.}$$

- Fast computation
- Assumes periodicity

Figure: First 5 Fourier basis functions on $[0, 1]$.

Different bases - Kernel induced basis

Kernel induced basis

- Let k be a non-negative definite kernel
- Kernel induced basis (Mercer's theorem)
- Eigenvectors of Gram matrix
- Matérn kernel yields Sobolev space [Bac20]

Can we choose a basis **optimally** for a specific problem / data set?

Functional Principal Components (FPCA)

- Let X be a zero mean, square integrable random variable in $L^2([0, 1])$.
- Can we find basis functions u_1, \dots, u_B minimising the loss

$$S(u_1, \dots, u_B) = \mathbb{E} \left\| X - \sum_{i=1}^B \langle X, u_i \rangle u_i \right\|^2 ?$$

- In fact taking u_1, \dots, u_B as in the Karhunen Loève expansion is solution, i.e. first B eigenfunctions of

$$(T_\gamma f)(t) = \int_0^1 \gamma(t, s) f(s) ds$$

where $\gamma(t, s)$ is the covariance function [Dun21].

Functional Principal Components (FPCA)

Figure: Sugar emission spectra at wavelength 230.

Figure: First 3 normalised functional principal components.

Generative Modelling

- Given a training set X learn the distribution $p(X)$
- Unsupervised learning \rightarrow leverage unlabelled data
- Data augmentation, data privacy, density estimation, out of distribution detection

Variational Autoencoder (VAE)

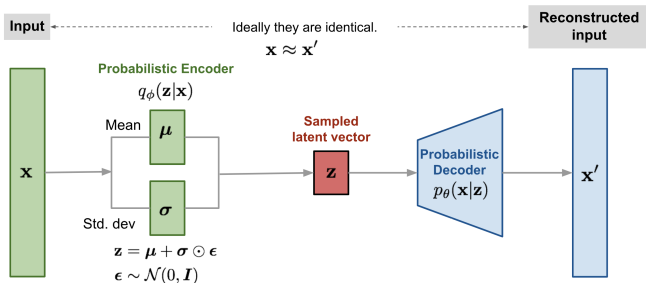

Figure: Gaussian VAE model architecture (Source²)

Maximise the ELBO (see [KW13]):

$$\mathcal{L}(\theta, \phi; \mathbf{x}) = -D_{KL}(q_\phi(\mathbf{z} | \mathbf{x}) || p_\theta(\mathbf{z})) + \mathbb{E}_{q_\phi(\mathbf{z}|\mathbf{x})} [\log p_\theta(\mathbf{x} | \mathbf{z})]$$

Variational Autoencoder on Hilbert spaces

Given function evaluation x_i^k at point s_i^k ([MFB20]):

$$\hat{x}_{e,i}^k = \beta_i^\top \Phi(s_i^k) \quad (1)$$

$$[z_\mu, z_{sd}]^\top = \text{Encoder}(\phi, \beta_i) \quad (2)$$

$$\mathcal{Z} \sim \mathcal{N}(z_\mu, z_{sd}^2 \mathbb{I}) \quad (3)$$

$$\hat{\beta}_i = \text{Decoder}(\theta, \mathcal{Z}) \quad (4)$$

$$\hat{x}_{d,i}^k = \hat{\beta}_i^\top \Phi(s_i^k). \quad (5)$$

Where $\Phi(s_i^k) = (\varphi_1(s_i^k) \dots \varphi_B(s_i^k))^T$ with $\{\varphi_j\}_{j=1}^B$ a set of B basis functions.

Data sets

Figure: Sugar emission spectra.

Figure: Electricity consumption.

Figure: Simulated data.

| Data set | N | M |
|---------------|------|-----|
| Simulated | 4000 | 100 |
| Sugar spectra | 268 | 571 |
| Gridwatch | 532 | 288 |

Table: Summary of data sets

Assessing the model performance

- Synthetic sample diversity - Visual comparison
- Discriminative comparison - Classifier and maximum mean discrepancy (MMD)
- Usefulness of synthetic samples - Application

Which basis should we choose?

| Basis | Data | $\widehat{\text{MMD}}_{CEXP}^2$ | Loss | Accuracy |
|---------|---------------|---------------------------------|-------|----------|
| Fourier | Simulated GP | 0.0001 | 0.688 | 0.534 |
| | Sugar Spectra | 0.036 | 0.577 | 0.701 |
| | Gridwatch | 3.49×10^{-22} | 0.697 | 0.476 |
| FPCA | Simulated GP | 0.011 | 0.655 | 0.604 |
| | Sugar Spectra | 0.002 | 0.697 | 0.515 |
| | Gridwatch | 6.67×10^{-15} | 0.693 | 0.494 |
| Matérn | Simulated GP | 0.001 | 0.692 | 0.519 |
| | Sugar Spectra | 0.045 | 0.640 | 0.746 |
| | Gridwatch | 3.34×10^{-10} | 0.694 | 0.5 |

Table: Results of the discriminative comparison.

Which basis should we choose?

A conditional model to battle mode collapse

- condition on other knowledge c
- $q_\phi(z|x, c)$ and $p_\theta(x|z, c)$ as the variational and inference models of the conditional VAE [SLY15].
- The ELBO becomes:

$$\mathcal{L}(\theta, \phi; x, c) = \mathbb{E}_{q_\phi(z|x, c)}[\log p_\theta(x|z, c)] - D_{KL}(q_\phi(z|x, c) \| p_\theta(z | c)).$$

- Sugar - spectra modes correspond wavelengths
- Gridwatch - modes correspond to day of the week

A conditional model to battle mode collapse

| Data set | Basis | Model type | $\widehat{\text{MMD}}_{\text{CEXP}}^2$ | Loss | Accuracy |
|-----------|---------|-------------|--|--------|----------|
| Sugar | FPCA | Conditional | 0.004 | 0.369 | 0.792 |
| | | Standard | 0.001 | 0.416 | 0.799 |
| | Matérn | Conditional | 0.019 | 0.163 | 0.954 |
| | | Standard | 0.003 | 0.133 | 0.96 |
| | Fourier | Conditional | 0.012 | 0.055 | 0.994 |
| | | Standard | 0.007 | 0.024 | 0.999 |
| Gridwatch | FPCA | Conditional | 5.19×10^{-163} | 0.6932 | 0.5 |
| | | Standard | 3.8×10^{-93} | 0.6932 | 0.5 |
| | Matérn | Conditional | 8.16×10^{-198} | 0.6932 | 0.5 |
| | | Standard | 7.74×10^{-73} | 0.6932 | 0.5 |
| | Fourier | Conditional | 1.64×10^{-265} | 0.6932 | 0.5 |
| | | Standard | 7.34×10^{-70} | 0.6932 | 0.5 |

Table: Simulation results for the discriminative comparison of conditional and standard models with different basis.

A conditional model to battle mode collapse

Figure: Synthetic samples with FPCA based basis for sugar data.

Figure: t-SNE projection for sugar data.

A conditional model to battle mode collapse

Figure: Synthetic samples with Fourier basis for gridwatch data.

Figure: t-SNE projection for sugar data.

Application

| Ash content | > 18 | ≤ 18 |
|------------------------|--------|-----------|
| Number of observations | 31 | 237 |

Table: Classification data set

Figure: Histogram of ash content in sugar samples.

Figure: Sugar spectra coloured corresponding to high or low ash content.

Application

Figure: Averaged accuracy of 4 independent runs on test set plotted against the ratio of number of samples containing a high ash content and number of samples containing a low ash content.

Conclusions

- Basis choice is dependent on data
- FPCA based basis yields good sample diversity
- Prevent mode collapse by conditioning on classes
- Significant improvements by augmenting data set with synthetic samples

Future Work:

- Fully functional VAE
- Other bases e.g. B-splines
- Method for sparse functional data

Question - MMD

Given a kernel k and the associated RKHS $\mathcal{H}_k(\mathcal{X})$ we define \mathcal{P} the set of Borel probability measures on \mathcal{X} . Furthermore, assuming k is measurable define $\mathcal{P}_k \subset \mathcal{P}$ as the set of all $P \in \mathcal{P}_k$ such that $\int k(x, x)^{\frac{1}{2}} dP(x) < \infty$. For $P, Q \in \mathcal{P}_k$ we define the Maximum Mean Discrepancy denoted $\text{MMD}_k(P, Q)$ as follows

$$\text{MMD}_k(P, Q) = \sup_{\|f\|_{\mathcal{H}_k(\mathcal{X})} \leq 1} \left| \int f dP - \int f dQ \right|.$$

CEXP:

$$k_{\text{C-exp}(F, l)}(s, t) = e^{-\frac{1}{2l^2}(s-t)^2} k_{\cos(F)}(s, t)$$

where $F \in \mathbb{N}$ and

$$k_{\cos(F)}(s, t) = \sum_{n=0}^{F-1} \cos(2\pi n(s-t)) \text{ on } [0, 1]^2.$$

Maximum mean discrepancy (MMD)

- Enables comparison of two samples on $L^2(\mathcal{D})$ with $\mathcal{D} \subset \mathbb{R}^d$
- Can be estimated unbiasedly by the Monte Carlo estimator

$$\widehat{\text{MMD}}_k(X_n, Y_n)^2 := \frac{1}{n(n-1)} \sum_{i \neq j}^n h(z_i, z_j),$$

where $h(z_i, z_j) = k(x_i, x_j) + k(y_i, y_j) - k(x_i, y_j) - k(x_j, y_i)$
and k is a kernel [WD20].

Question - Matérn kernel basis

The Matérn is kernel defined by

$$k_M(x, x') = \frac{2^{1-\nu}}{\Gamma(\nu)} \left(\frac{\sqrt{2\nu} \|x - x'\|_2}{\sigma} \right) K_\nu \left(\frac{\sqrt{2\nu} \|x - x'\|_2}{\sigma} \right), \quad \sigma, \nu > 0,$$

where K_ν is the modified Bessel function of second kind of order ν and Γ is the Gamma function.

- Translation invariant \rightarrow Bochner's theorem
- Evaluate the kernel on a dense grid $t_1, \dots, t_n \in \mathcal{I}$
- Obtain the Gram matrix defined by $G_{ij} = k(t_i, t_j)$ for $i, j = 1, \dots, n$
- Compute the eigenvectors of the Gram matrix
- Interpolate eigenvectors to obtain eigenfunctions

Question - Karhunen Loève expansion

Theorem (Karhunen Loève)

Let $\{X_t, t \in [0, 1]\}$ be a zero mean process on $L^2([0, 1])$ with continuous covariance function $\gamma(s, t)$. Then

$$X_t = \sum_{n=1}^{\infty} \xi_n e_n(t), \quad t \in [0, 1],$$

where $\xi_n = \int_0^1 X_t e_n(t) dt$ and $\{\lambda_n, e_n(t)\}_{n=1}^{\infty}$ are the eigenvalues and eigenfunctions of T_γ . Furthermore, we have that $\mathbb{E}\xi_n = 0$ and $\mathbb{E}(\xi_n \xi_m) = \lambda_n \delta_{n,m}$.

Here the integral operator T_γ associated with γ is defined by

$$(T_\gamma f)(t) = \int_0^1 \gamma(t, s) f(s) ds.$$

Question - Karhunen Loève expansion

- Series converges in L^2 to $X(t)$, uniformly in t
- Coefficients are random variables and contain information about the variability around the eigenfunctions
- Represent realisations of the stochastic process as realisations of random coefficients
- Uncorrelated coefficients are independent for a Gaussian processes:

$$X_t = \sum_{n=1}^{\infty} \sqrt{\lambda_n} \xi_n e_n(t),$$

where $\{\xi_n\}_{n=1}^{\infty}$ are independent $\mathcal{N}(0, 1)$

Question - t-SNE

- t-distributed stochastic neighbour embedding
- Construct probability distribution over pairs of observations, similar pairs yield high probability
- Construct similar distribution over lower dimensional representation
- minimise Kullback-Leibler Divergence between distributions
